Problem – Solution Fit Template

Date	19 July 2026
Team ID	
Project Name	Nutrition Assistant
Team Members	Kulasri Durga Deepika Bora Polimera Girija(Team lead)
Maximum Marks	2 Marks

Problem–Solution Fit Canvas

Canvas Block	NutriPulse Project Response
1. Customer Segments	College students, young professionals and health-conscious users who need simple daily nutrition and hydration tracking.
2. Jobs-to-be-Done / Problems	Track meals, calories, nutrients, water and BMI; understand progress; maintain consistency; receive relevant guidance.
3. Triggers	Weight change, low energy, health advice, fitness goals, placement/college routines, doctor or family suggestions.
4. Emotions – Before / After	Before: confused, inconsistent, worried, unmotivated. After: informed, motivated, confident and in control.
5. Available Solutions	Paper notes, spreadsheets, separate calorie/water/BMI apps, generic diet content. Weakness: fragmented tracking and limited personalization.
6. Customer Constraints	Busy schedule, limited nutrition knowledge, forgotten entries, device/internet limitations, reluctance to use complex apps.
7. Behaviour	Users skip logging, estimate intake mentally, search health tips online and check weight only occasionally.
8. Channels of Behaviour	Online: web apps, mobile browsers, social media, health websites. Offline: food labels, water bottles, weighing scale, doctor/family advice.
9. Problem Root Cause	Health information is distributed across multiple sources and daily tracking is not integrated into the user's routine.
10. NutriPulse Solution	A secure full-stack web application combining meal tracking, water tracking, BMI history, profile-based goals, dashboard analytics and rule-based recommendations.

Fit Validation

- The solution matches the customer's existing online behaviour by providing a browser-based application.
- Quick forms and dashboard summaries reduce the effort required to understand daily health records.

- Profession- and goal-based recommendations increase relevance without claiming medical diagnosis.
- The modular architecture allows reminders, reports and mobile features to be added later.
